# **Assignment 3**

In this assignment you will explore text message data and create models to predict if a message is spam or not.

## In [1]:

```
import pandas as pd
import numpy as np

spam_data = pd.read_csv('spam.csv')

spam_data['target'] = np.where(spam_data['target']=='spam',1,0)
spam_data.head(10)
```

## Out[1]:

	text	target
0	Go until jurong point, crazy Available only	0
1	Ok lar Joking wif u oni	0
2	Free entry in 2 a wkly comp to win FA Cup fina	1
3	U dun say so early hor U c already then say	0
4	Nah I don't think he goes to usf, he lives aro	0
5	FreeMsg Hey there darling it's been 3 week's n	1
6	Even my brother is not like to speak with me. $\dots$	0
7	As per your request 'Melle Melle (Oru Minnamin	0
8	WINNER!! As a valued network customer you have	1
9	Had your mobile 11 months or more? U R entitle	1

# **Question 1**

What percentage of the documents in spam data are spam?

This function should return a float, the percent value (i.e. ratio \* 100).

```
In [3]:
```

```
def answer_one():
    ans = np.sum(spam_data['target'])/len(spam_data)
    return ans * 100 #Your answer here
```

```
In [4]:
```

```
answer_one()
Out[4]:
```

13.406317300789663

# **Question 2**

Fit the training data X\_train using a Count Vectorizer with default parameters.

What is the longest token in the vocabulary?

This function should return a string.

## In [5]:

```
from sklearn.feature_extraction.text import CountVectorizer

def answer_two():
    vect = CountVectorizer().fit(X_train)
    length = [len(x) for x in vect.get_feature_names()]
    ind = length.index(max(length))
    ans = vect.get_feature_names()[ind]

    return ans #Your answer here
```

```
In [6]:
```

```
answer_two()
```

Out[6]:

# **Question 3**

Fit and transform the training data X\_train using a Count Vectorizer with default parameters.

Next, fit a multinomial Naive Bayes classifier model with smoothing alpha=0.1. Find the area under the curve (AUC) score using the transformed test data.

This function should return the AUC score as a float.

<sup>&#</sup>x27;com1win150ppmx3age16subscription'

```
In [7]:
```

```
from sklearn.naive_bayes import MultinomialNB
from sklearn.metrics import roc_auc_score

def answer_three():
    vect = CountVectorizer().fit(X_train)
    X_train_vectorized = vect.transform(X_train)

    clf = MultinomialNB(alpha = 0.1)
    clf.fit(X_train_vectorized, y_train)
    predictions = clf.predict(vect.transform(X_test))
    ans = roc_auc_score(y_test, predictions)

    return ans #Your answer here
```

```
In [8]:
```

```
answer_three()
```

Out[8]:

0.97208121827411165

## **Question 4**

Fit and transform the training data X\_train using a Tfidf Vectorizer with default parameters.

What 20 features have the smallest tf-idf and what 20 have the largest tf-idf?

Put these features in a two series where each series is sorted by tf-idf value and then alphabetically by feature name. The index of the series should be the feature name, and the data should be the tf-idf.

The series of 20 features with smallest tf-idfs should be sorted smallest tfidf first, the list of 20 features with largest tf-idfs should be sorted largest first.

This function should return a tuple of two series (smallest tf-idfs series, largest tf-idfs series).

#### In [9]:

```
from sklearn.feature extraction.text import TfidfVectorizer
def answer_four():
    vect = TfidfVectorizer().fit(X_train)
    X_train_vectorized = vect.transform(X_train)
    feature_names = np.array(vect.get_feature_names())
    sorted_tfidf_index = X_train_vectorized.max(0).toarray()[0].argsort()
    s1 = pd.DataFrame(feature names[sorted tfidf index[:20]], columns = ['feature names'])
    s1['data'] = X_train_vectorized.max(0).toarray()[0][sorted_tfidf_index[:20]]
    s1.sort_values(by=['feature_names'], inplace=True)
    s1 = pd.Series(list(s1['data']), index = list(s1['feature_names']))
    s2 = pd.DataFrame(feature_names[sorted_tfidf_index[-1:-21:-1]], columns = ['feature_names]
    s2['data'] = X_train_vectorized.max(0).toarray()[0][sorted_tfidf_index[-1:-21:-1]]
    s2.sort_values(by=['feature_names'], inplace=True)
    s2 = pd.Series(list(s2['data']), index = list(s2['feature_names']))
    ans = (s1, s2)
    return ans #Your answer here
```

```

## **Question 5**

Fit and transform the training data X\_train using a Tfidf Vectorizer ignoring terms that have a document frequency strictly lower than 3.

Then fit a multinomial Naive Bayes classifier model with smoothing alpha=0.1 and compute the area under the curve (AUC) score using the transformed test data.

This function should return the AUC score as a float.

```
In [11]:
```

```
def answer_five():
    vect = TfidfVectorizer(min_df=3).fit(X_train)
    X_train_vectorized = vect.transform(X_train)
    clf = MultinomialNB(alpha = 0.1)
    clf.fit(X_train_vectorized, y_train)
    predictions = clf.predict(vect.transform(X_test))
    ans = roc_auc_score(y_test, predictions)
    return ans #Your answer here
```

```
In [12]:
```

```
answer_five()
Out[12]:
0.94162436548223349
```

## **Question 6**

What is the average length of documents (number of characters) for not spam and spam documents?

This function should return a tuple (average length not spam, average length spam).

## In [13]:

```
spam = spam_data[spam_data['target'] == 1]
not_spam = spam_data[spam_data['target'] == 0]

def answer_six():
    spam_char_count = [len(x) for x in spam['text']]
    avg_spam = np.sum(spam_char_count)/len(spam)

not_spam_char_count = [len(x) for x in not_spam['text']]
    avg_not_spam = np.sum(not_spam_char_count)/len(not_spam)

ans = (avg_not_spam, avg_spam)

return ans #Your answer here
```

```
In [14]:
```

```
answer_six()
Out[14]:
(71.023626943005183, 138.8661311914324)
```

The following function has been provided to help you combine new features into the training data:

```
In [15]:
```

```
def add_feature(X, feature_to_add):
    """

    Returns sparse feature matrix with added feature.
    feature_to_add can also be a list of features.
    """

    from scipy.sparse import csr_matrix, hstack
    return hstack([X, csr_matrix(feature_to_add).T], 'csr')
```

## **Question 7**

Fit and transform the training data X\_train using a Tfidf Vectorizer ignoring terms that have a document frequency strictly lower than **5**.

Using this document-term matrix and an additional feature, **the length of document (number of characters)**, fit a Support Vector Classification model with regularization C=10000. Then compute the area under the curve (AUC) score using the transformed test data.

This function should return the AUC score as a float.

#### In [20]:

```
from sklearn.svm import SVC

def answer_seven():

    vect = TfidfVectorizer(min_df=5).fit(X_train)
    X_train_vectorized = vect.transform(X_train)

    train_char = [len(x) for x in X_train]
    train_added = add_feature(X_train_vectorized, train_char)
    test_char = [len(x) for x in X_test]
    test_added = add_feature(vect.transform(X_test), test_char)

    clf = SVC(C=10000).fit(train_added, y_train)
    predictions = clf.predict(test_added)

    ans = roc_auc_score(y_test, predictions)

    return ans #Your answer here
```

```
In [21]:
```

```
answer_seven()
```

Out[21]:

0.95813668234215565

## **Question 8**

What is the average number of digits per document for not spam and spam documents?

This function should return a tuple (average # digits not spam, average # digits spam).

```
In [24]:
```

```
import re
def answer_eight():

spam_digit_count = [len(re.findall(r'\d{1}',x)) for x in spam['text']]
avg_spam = np.sum(spam_digit_count)/len(spam)

not_spam_digit_count = [len(re.findall(r'\d{1}',x)) for x in not_spam['text']]
avg_not_spam = np.sum(not_spam_digit_count)/len(not_spam)

ans = (avg_not_spam, avg_spam)

return ans #Your answer here
```

```
In [25]:
```

```
answer_eight()
Out[25]:
(0.29927461139896372, 15.759036144578314)
```

## **Question 9**

Fit and transform the training data X\_train using a Tfidf Vectorizer ignoring terms that have a document frequency strictly lower than **5** and using **word n-grams from n=1 to n=3** (unigrams, bigrams, and trigrams).

Using this document-term matrix and the following additional features:

- the length of document (number of characters)
- number of digits per document

fit a Logistic Regression model with regularization C=100. Then compute the area under the curve (AUC) score using the transformed test data.

This function should return the AUC score as a float.

```
In [28]:
```

```
from sklearn.linear_model import LogisticRegression

def answer_nine():

    vect = TfidfVectorizer(min_df=5, ngram_range=(1,3)).fit(X_train)
    X_train_vectorized = vect.transform(X_train)

    train_char = [len(x) for x in X_train]
    train_digit_count = [len(re.findall(r'\d{1}',x)) for x in X_train]
    train_added = add_feature(X_train_vectorized, [train_char, train_digit_count])
    test_char = [len(x) for x in X_test]
    test_digit_count = [len(re.findall(r'\d{1}',x)) for x in X_test]
    test_added = add_feature(vect.transform(X_test), [test_char, test_digit_count])

clf = LogisticRegression(C = 100).fit(train_added, y_train)
    predictions = clf.predict(test_added)
    ans = roc_auc_score(y_test, predictions)

return ans #Your answer here
```

```
In [29]:
```

```
answer_nine()
```

Out[29]:

0.96533283533945646

## **Question 10**

What is the average number of non-word characters (anything other than a letter, digit or underscore) per document for not spam and spam documents?

Hint: Use \w and \W character classes

This function should return a tuple (average # non-word characters not spam, average # non-word characters spam).

In [30]:

```
def answer_ten():
    spam_not_word_count = [len(re.findall(r'\W{1}',x)) for x in spam['text']]
    avg_spam = np.sum(spam_not_word_count)/len(spam)

not_spam_not_word_count = [len(re.findall(r'\W{1}',x)) for x in not_spam['text']]
    avg_not_spam = np.sum(not_spam_not_word_count)/len(not_spam)

ans = (avg_not_spam, avg_spam)

return ans #Your answer here
```
